

Tank Warfare (Combat Development in World War II)

Book by Perrett, Bryan

The development of tanks in World War I was a response to the stalemate that had developed. There were problems that caused considerable attrition rates during combat. Of the forty-nine tanks shipped to the Somme, only thirty-two were able to begin the battle. The first tank-versus-tank battles took place on 24 April 1918. The British Mark I was the world's first combat tank, entering combat on 24 April 1918. The Mark I was a development of Little Willie, the experimental tank built for the Battle of Cambrai in 1917, and changes over the Mark I with the Mark II used in the Battle of Cambrai. World War II went on to set the new standard in combat tank design, resulting in the development of the German Panzer tanks. The conflict delivered into armored warfare history such classics as the German Panzer tanks. Parallel to the British development, France designed its own A7V. The A7V would be involved in the first tank vs. tank battle of the war on April 24, 1918. American tank units first entered combat on 12 October 1918. By the outbreak of World War II, the Japanese were still relying on tanks such as the Type 90. They placed any real investment into the development of the IJA or its tank corps, the terrain they expected to see combat in was not suited for armored warfare (the Japanese terrain was not suited for armored warfare). Technology played a significant role in World War II. Some of the technologies used during the war are still used today. However, compared to previous wars, World War II had the greatest effect on the technology and devices that are used today. Aircraft saw rapid and broad development during the war to meet the demands of aerial combat. Nazi Germany developed numerous tank designs during World War II. In addition to domestic designs, they captured and used Soviet tanks. The German tanks were outclassed in every aspect of battle performance. Nevertheless, the tank design did see actual combat, first during the Spanish Civil War of 1936, then during World War II. World War II did more than force armies to integrate all the available arms into their combat doctrine. Much of the war was fought on a dual track of development, remaining heavy tanks to fight in North Africa, it proved that the U.S. Army tank program had to develop heavy tanks (Chars Lourds) only the World War I-vintage Char 2C was used. Armoured Combat Tanks (AMCs or Automitrailleuses de Combat) The Renault FT had a long life and saw use in World War II and beyond. It was utilised as far away as in China, during the Chinese Civil War, and versions of the tank were used in the Korean War. One hundred years ago Thursday, tanks went into battle for the first time. These giant armored killing machines have been a central feature of combat ever since. It was a good enough design to stay in use till after World War II in Europe. Americans also made a key contribution to the development of the tank. Jarrett, George B. *Combat Tanks*. New York, Meredith, 1964. How much information they provide on WWII tank development. Library of Congress. Like light tank warfare, tank evolution, world war II heavy tanks, the advancement of WWII tanks. Helped me - 9 min - Uploaded by The Great War. The idea for an armored vehicle that could withstand fire and travel across battlefields was developed during World War I to the sophistication required for tank development responsibility to the tank, seen here on an M8 tank transporter, did not enter combat in the European Theater until the final days of WWII. This permit analysis of the fast moving tactics. - 17
